

Software Requirements Specification (SRS)

Project: Mr. Manager (TalentOS) MVP

Comprehensive Module-by-Module Technical Specification and Roadmaps

Prepared For:	Mayank Jain (Acme Corp)
Date:	July 2026
Version / Status:	v1.1 (Detailed Specifications Expansion)

1. Introduction and Project Scope

1.1 Purpose

This expanded Software Requirements Specification (SRS) document details the design, architecture, and granular functional/non-functional requirements of 'Mr. Manager' (formerly TalentOS). Mr. Manager is a modern, unified virtual manager platform designed to automate and simplify crucial business workflows including candidate hiring, AI-driven resume screening, employee training/onboarding, calling CRM, and performance reporting. This version provides detailed feature listings and improvements for every functional module.

1.2 Architecture & Data Strategy

The application is engineered using React 18 for client rendering, styled via modern custom CSS variables, and powered by Supabase PostgreSQL database hosting. High-integrity data operations rely on Supabase client-side abstractions, with Anthropic's Claude API handling asynchronous AI requirements (resume screening & JD writing) and the Resend API executing transactional and compliance-based email pipelines.

2. Detailed Functional Modules Specification

2.1 Requisitions and Job Management

This module manages internal hiring requisitions and the drafting of public job postings. It allows managers to set core job metadata and generate detailed, professional descriptions using AI.

2.1.1 Key Features

- **Job Requisition Intake:** Form inputs to capture Title, Department, Location (e.g. Bangalore, Remote), Employment Type (Full-time, Contract, etc.), Target Salary Range, and Required Core Skills.
- **Claude AI JD Generator:** One-click generation that packages the metadata and queries the Anthropic Claude API to generate a well-structured, professional job description containing role overview, key responsibilities, and nice-to-have skills.
- **Job Status Pipeline:** Enables HR to progress job postings across Draft, Active (visible for candidate applications), Paused, and Closed states.

2.1.2 Scope of Improvements

- **Automated Job Portal Sync:** Develop outbound webhook integrations to auto-post active job listings to LinkedIn, Indeed, and Naukri, complete with candidate backlink tracking parameters.
- **Approval Workflows:** Add a multi-stage workflow where requisitions must be approved by the Department Head and CFO before shifting to 'Active' status.
- **Custom Brand JD Styling:** Allow HR to upload JD templates with specific company branding blocks, auto-generating standard header and footer blocks on every generated JD.

2.2 AI-Powered Resume Screening

The resume screening module automates candidate assessment by comparing text content of uploaded CVs against the active job descriptions, providing detailed feedback scores and recommendations.

2.2.1 Key Features

- **Text Extraction & Input:** Accepts resume text blobs alongside candidate profile info, matching them to a specific job vacancy record.
- **Multi-Dimensional Scoring:** Queries the AI engine to generate specific match percentages: Experience Match, Skills Match, and Education Match, alongside an overall composite score (0-100).
- **Strengths & Gaps Analysis:** Provides bulleted lists of specific candidate strengths and noticeable skill/educational gaps based on the JD requirements.
- **Qualifying Questions & Dealbreakers:** Supports evaluating candidates against key questions (e.g., 'Is the candidate willing to work in Bangalore?'). If a dealbreaker question is failed, the system automatically demotes the status to Reject.

2.2.2 Scope of Improvements

- **Bulk PDF Uploads with OCR:** Integrate PDF/Docx text parsing libraries (like pdf.js and Tesseract OCR) to allow HR to drag and drop multiple resume files, parsing them in the background without manual copy-paste.
- **Interactive Score Weighting:** Provide sliders in the UI allowing HR to adjust the importance of Experience vs. Skills vs. Education, recalculating the candidate score dynamically.
- **Custom Screening Prompt Editor:** Provide an administrative screen where HR can edit the core prompt template sent to Claude to tailor evaluations to specific corporate cultures.

2.3 Candidate Consent and Resend Integration

This module manages candidate communication, complying with privacy policies by requesting explicit applicant consent before moving them to subsequent evaluation stages.

2.3.1 Key Features

- **Resend Transactional Emailing:** HR triggers compliance emails via Resend containing job summaries, offer specs, and unique URL consent tokens.
- **Public Consent Landing Page:** Provides a landing route (/consent?token=X&action=accept) where candidates review terms and accept or decline evaluation. Actions update the database status instantly.
- **Sandbox Simulation:** Ensures continuous operation by simulating successful email dispatches in local/offline developer preview environments when Resend API keys are absent.

2.3.2 Scope of Improvements

- **Multi-Channel Messaging:** Integrate WhatsApp Business API (via Twilio) to send consent reminders, interview slot selection links, and quiz details directly to candidate mobile devices.
- **Automated Scheduler Linkage:** Upon consent acceptance, immediately trigger a calendar booking page (Cal.com or Google Calendar) for candidates to book an interview slot based on live manager slots.
- **Consent Log Audit Trail:** Store candidate IP address, timestamp, and terms version in an immutable database audit log for GDPR/legal compliance.

2.4 Training and Onboarding Curriculum

Once hired, candidates transition into employees, who must complete role-tagged training curricula to finalize their onboarding status.

2.4.1 Key Features

- **Role-Tagged Curricula:** Pulls mandatory onboarding modules (videos, documents) filtered by tags like 'Sales', 'Engineering', or 'All'.
- **Self-Evaluation Quizzes:** Supports internal quiz evaluations testing core concepts, requiring a minimum score (typically 80%) to pass.
- **Manager Approval Pipeline:** Completed training logs and quiz scores are submitted to the manager's dashboard for final sign-off.

2.4.2 Scope of Improvements

- **Interactive Coding & Script Playgrounds:** Add Monaco Editor sandboxes for developers to execute test code, or mock client dialog simulators for sales personnel inside onboarding pages.
- **Dynamic PDF Certificate Generator:** Automatically generate a branded, serial-numbered PDF completion certificate using HTML5 Canvas once a manager signs off on the onboarding.
- **Curriculum Progress Visualizer:** Add visual step-trackers showing remaining modules, estimated completion times, and a countdown for onboarding deadlines.

2.5 Lead CRM and Task Board

Designed to track sales prospects and employee task lists, this module connects lead generation with daily operational checklists.

2.5.1 Key Features

- **CRM Lead Stage Pipeline:** Displays leads categorized by status: New, Interested, Callback (with reminder logs), Converted, and Lost.
- **Call Logging Desk:** Enables sales reps to enter call duration, log comments, and save dispositions (Connected, Busy, Wrong Number).
- **Profile-Tagged Checklists:** Loads operational task checklists (e.g. daily standups, review open PRs) matching the logged-in user's profile roles.

2.5.2 Scope of Improvements

- **In-App WebRTC Softphone:** Integrate a calling gateway (like Twilio Client) to allow reps to initiate calls directly from the browser with single-click dialing.
- **Interactive Call Flow Prompts:** Show dynamic scripts to the user based on the selected lead's department, suggesting key talking points and handling common objections.
- **Task Recurrence Scheduling:** Support setting custom calendar recurrence rules (e.g., bi-weekly, every second Monday) and automatic task assignments for specific departments.

2.6 Analytics Reports

A critical hub for executive and management review, compiling database tables into structured performance metrics.

2.6.1 Key Features

- **Hiring Funnel Status:** Tracks and aggregates candidate numbers at every stage (Applied, Screened, Shortlisted, Hired).
- **Onboarding Compliance Logs:** Highlights compliance completion percentages among active employees, flagging individuals behind schedule.
- **CRM Performance Data:** Summarizes total dials, connected calls, and converted leads for specific sales representatives.

2.6.2 Scope of Improvements

- **One-Click BI Data Exports:** Provide buttons to export all charts and metrics to CSV, Excel (XLSX), and raw PDF data logs.
- **Interactive Data Visualizations:** Integrate library rendering (Recharts) to show interactive bar charts, funnel flows, and pie distributions with date-range filters.
- **Automated Slack/Email Reports:** Configure scheduled tasks to generate and dispatch weekly summary report cards directly to executives.

3. Non-Functional Requirements

3.1 Row Level Security (RLS)

NFR-1.1: Every database table in Supabase must enforce strict RLS policies, restricting read/write operations to authenticated sessions.

NFR-1.2: Client routes must validate user roles before rendering pages, automatically redirecting unauthorized requests to the Dashboard.

3.2 Reliability and Offline Resilience

NFR-2.1: The application must load and remain functional using in-memory fallbacks when Supabase, Claude, or Resend APIs are unavailable, showing warning banners instead of crashing.
